A1.1 Design of the anchoring equipment

(1981)

A1.1.1 The anchoring equipment required herewith is intended for temporary mooring of a vessel within a harbour or sheltered area when the vessel is awaiting berth, tide, etc.

A1.1.2 The equipment is therefore not designed to hold a ship off fully exposed coasts in rough weather or to stop a ship which is moving or drifting. In this condition the loads on the anchoring equipment increase to such a degree that its components may be damaged or lost owing to the high energy forces generated, particularly in large ships.

A1.1.3 The anchoring equipment presently required herewith is designed to hold a ship in good holding ground in conditions such as to avoid dragging of the anchor. In poor holding ground the holding power of the anchors will be significantly reduced.

A1.1.4 The Equipment Numeral (EN) formula for anchoring equipment required here under is based on an assumed current speed of 2.5 m/sec, wind speed of 25 m/sec and a scope of chain cable between 6 and 10, the scope being the ratio between length of chain paid out and water depth.

A1.1.5 It is assumed that under normal circumstances a ship will use only one bow anchor and chain cable at a time.

A1.1.6 Manufacture of anchors and anchor chain cables is to be in accordance with UR W29 and UR W18.

A1.2 Equipment number and anchoring equipment table (for vessels of unrestricted service)

(1981) (1999)

The equipment of anchors and chain cables is to be as given in Table 1 and is to be based on an “Equipment Number” calculated as follows:

$$EN = \Delta^{2/3} + 2,0 hB + \frac{A}{10}$$

Where:

Δ = moulded displacements, in tonnes, to the Summer Load Waterline

B = moulded breadth, in metres

h = effective height, in metres, from the Summer Load Waterline to the top of the uppermost house; for the lowest tier “h” is to be measured at centerline from the upper deck or from a notional deck line where there is local discontinuity in the upper deck.

$$h = a + \sum h_i$$

Where:

a = distance, in metres, from the Summer Load Waterline amidships to the upper deck

h_i = height, in metres, on the centerline of each tier of houses having a breadth greater than B/4

Note:

Rev.5 of this UR is to be uniformly implemented by IACS Societies on anchors and anchor chain cables the manufacturing of which is commenced on or after 1 January 2007.

A1

cont'd

A = area, in square metres, in profile view, of the hull, superstructures and houses above the Summer Load Waterline which are within the Equipment length of the vessel and also have a breadth greater than B/4.

NOTES

1. When calculating h, sheer and trim are to be ignored, i.e. h is the sum of freeboard amidships plus the height (at centerline) of each tier of houses having a breadth greater than B/4.
2. If a house having a breadth greater than B/4 is above a house with a breadth of B/4 or less then the wide house is to be included but the narrow house ignored.
3. Screens or bulwarks 1,5 m or more in height are to be regarded as parts of houses when determining h and A. The height of the hatch coamings and that of any deck cargo, such as containers, may be disregarded when determining h and A. With regard to determining A, when a bulwark is more than 1,5 m high, the area shown below as A₂ should be included in A.

4. The equipment length of the vessels is the length between perpendiculars but is not to be less than 96% nor greater than 97% of the extreme length on the Summer Waterline (measured from the forward end of the Waterline).
5. The total length of chain given in Table 1 - col. 4- is to be divided in approximately equal parts between the two bower anchors

A1.3 Anchoring equipment for special purpose ships (tugs and dredgers) (1981)

A1.3.1 Equipment for tugs (1994/Corr. 95)

For tugs of unrestricted service the equipment shall be provided in compliance with the present requirement.

However, for the determination of the “Equipment Number”, in the formula given in A1.2, the following may be substituted for the term 2.0 hB

$$2.0 (aB + \sum h_{ibi})$$

where

a, B and h_i are defined in A1.2,

h_i is the breadth, in metres, of the widest superstructure or deckhouse of each tier having a breadth greater than B/4.

For tugs of restricted service the equipment shall be provided at the discretion of each individual Classification Society.

A1.3.2 Equipment for dredgers

For dredgers of unrestricted service having normal ship shape of underwater part of the hull the anchoring equipment shall be provided in accordance with the present Requirement.

When calculating the Equipment Number bucket ladders and gallows are not to be included. If however a dredger has unusual design of the underwater part of the hull, each Classification Society is free to modify the requirements to anchoring equipment.

As far as dredgers of limited service are concerned, the equipment is to be provided at the discretion of each individual Classification Society.

A1

cont'd

A1.4 Anchors (Rev. 1 1987) (Rev. 4 1999)

A1.4.1 Types of Anchors

A1.4.1.1 Ordinary anchors

- (a) Ordinary anchors of “stockless” type are to be generally adopted and they are to be of appropriate design in compliance with the rules or practice of each individual Society.
- (b) The mass of the heads of stockless anchors including pins and fittings are not to be less than 60% of the total mass of the anchor.
- (c) The mass, per anchor, of bower anchor given in Table 1 is required for anchors of equal mass. The mass of individual anchor may vary to 7% of the Table mass provided that the total mass of anchors is not less than that required for anchors of equal mass.

A1.4.1.2 High holding power (HHP) anchors

- (a) A “high holding power” anchor is to be suitable for ship’s use and is not to require prior adjustment or special placement on the sea bottom.
- (b) When special type of anchors designated “high holding power anchor” of proven superior holding ability are used as bower anchors, the mass of each anchor may be 75% of the mass required for ordinary stockless bower anchors in the Table 1.
- (c) For approval and/or acceptance as a HHP anchor satisfactory tests are to be made on various types of bottom, and the anchor is to have a holding power at least twice than of an ordinary stockless anchor of the same weight. Full scale tests are to be carried out at sea on various types of bottom and to be applied to anchors the weights of which are, as far as possible, representative of the full range of sizes proposed; for a definite group of the range the two anchors selected for testing (ordinary stockless anchors and HHP anchors) should be of approximately the same weight, and should be tested in association with the size of chain cable appropriate to this weight. The length of cable with each anchor should be such that the pull on the shank remains practically horizontal, for this purpose a scope of 10 is considered normal but a scope of not less than 6 may be accepted. Scope is defined as the ratio of length of cable to depth of water. Three tests shall be taken for each anchor and nature of bed. The pull shall be measured by dynamometer. The stability of the anchor and ease of breaking out should be noted where possible. Tests are normally to be carried out from a tug but alternatively shore based tests may be accepted. Measurements of pull based on RPM/bollard pull curve of tug may be accepted instead of dynamometer readings. Tests in comparison with a previously approved HHP anchor may be accepted as a basis for approval. For approval and/or acceptance of high holding power anchors of the whole range of weight, tests should be carried out on at least two - sizes of anchors and the weight of the maximum size to be approved could be accepted up to 10 times the weight of large size tested.

A1.4.1.3 Super high holding power (SHHP) anchors

- (a) Definition

A super high holding power anchor is an anchor with a holding power of at least four times that of an ordinary stockless anchor of the same mass. A super high holding power anchor is suitable for restricted service vessels’ use and does not require prior adjustment or special placement on the sea bed.

A1
cont'd

(b) Limitations to Usage

The use of SHHP anchors is limited to restricted service vessels as defined by the individual classification society.

The SHHP anchor mass should generally not exceed 1500kg.

(c) Application

The unified requirement for the design of SHHP anchors applies down to $EN \geq 205$. For $EN < 205$ the design criteria for SHHP anchors apply to the anchor mass given in Recommendation 10 for ordinary stockless anchors, reduced as permitted in accordance with 1.1 (b) of Recommendation 10.

(d) Anchor Design

i) Anchor Use

A super high holding power anchor is to be suitable for vessels in restricted service and is not to require prior adjustment or special placement on the sea bed.

ii) Anchor Mass

When super high holding power anchors of the proven holding power given in e) below are used as bower anchors, the mass of each such anchor may be reduced to not less than 50% of the mass required for ordinary stockless anchors in Table 1.

(e) Anchor Holding Power

For approval and/or acceptance as a SHHP anchor satisfactory full scale tests are to be made confirming that the anchor has a holding power of at least four times that of an ordinary stockless anchor or at least two times that of a previously approved HHP anchor, of the same mass. The tests are also to verify that the anchor withstands the test without permanent deformation.

(f) Anchor Holding Power Tests

i) The full scale tests required by e) are to be carried out at sea on three types of bottom; normally, soft mud or silt, sand or gravel and hard clay or similar compounded material. The tests are to be applied to anchors of mass which are as far as possible representative of the full range of sizes proposed.

For a definite group within the range, the two anchors selected for testing (ordinary stockless and SHHP anchors) should be approximately the same mass and should be tested in association with the size of chain required for the anchor mass and anchor type. Where an ordinary stockless anchor is not available, a previously approved HHP anchor may be used in its place. The length of the cable with each anchor should be such that the pull on the shank remains practically horizontal. For this purpose a scope of 10 is considered normal.

Three tests shall be taken for each anchor and each type of bottom. The pull shall be measured by dynamometer. The stability of the anchor and ease of breaking out should be noted where possible. Tests are to be carried out from a tug but alternatively shore based tests may be accepted. Measurements of pull, based on the RPM/bollard pull curve of the tug may be accepted as an alternative to dynamometer.

Tests in comparison with a previously approved SHHP anchor may be also accepted as a basis for approval.

If approval is sought for a range of anchor sizes, then at least three anchor sizes are to be tested, indicative of the bottom, middle and top of the mass range.

ii) The holding power test load is not to exceed the proof load of the anchor.

A1
cont'd

A1.4.2 Installation of the anchors on board

Two bower anchors of the three bower anchors under col. 2 of Table 1 are to be connected to their cables and positioned on board ready for use while the third anchor is intended as a spare bower anchor. Installation of the spare bower anchor on board is not compulsorily required. Each Classification Society is free to permit other arrangements at its discretion or not to require the spare anchor as a condition of classification.

A1.4.3 Proof testing of anchors

A1.4.3.1 Testing of ordinary anchors

- (i) The proof load as per Table 2 is to be applied on the arm or on the palm at a spot which, measured from the extremity of the bill, is one-third of the distance between it and the centre of the crown.
In the case of stockless anchors, both arms are to be tested at the same time, first on one side of the shank, then reversed and tested on the other.
- (ii) Anchors of all sizes should be proof tested with the test loads stipulated in the Table 2.
- (iii) Before application of proof test load the anchors are to be examined to be sure that castings are reasonably free of surface imperfections of harmful nature.
After proof load testing the anchors are to be examined for cracks and other defects.
On completion of the proof load tests the anchors made in more than one piece are to be examined for free rotation of their heads over the complete angle.
In every test the difference between the gauge lengths (as shown in figures) where one-tenth of the required load was applied first and where the load has been reduced to one-tenth of the required load from the full load may be permitted not to exceed one percent (1%).

A1.4.3.2 Testing of HHP anchors

The HHP anchor is to be proof tested with load required by Table 2 for an anchor mass equal to 1.33 times the actual mass of the HHP anchor. The proof loading procedure and examination procedure for HHP anchors are to comply with those for ordinary anchors, A1.4.3.1(iii).

A1
cont'd

Stocked Anchor

Stockless Anchor

A1.4.3.3 Testing of SHHP Anchors

A1.4.3.3.1 Anchor Proof Test

The SHHP anchor is to be proof tested with the load required by Table 2 for an anchor mass equal to 2 times the actual mass of the SHHP anchor. The proof loading procedure and examination procedure for SHHP anchors are to comply with those for ordinary anchors, A1.4.3.1 (iii).

A1.4.3.3.2 Anchor inspections and Additional Tests

After the proof load test, all SHHP anchors are to be surface inspected by the dye penetrant method or by the magnetic particle method. All surfaces of cast steel anchors are to be surface inspected. The surface inspections are to follow Guidelines for NDE of Hull and Machinery Steel Castings. All cast steel anchors are to be examined by UT in way of areas where feeder heads and risers have been removed and where weld repairs have been carried out. The UT inspections are to follow Guidelines for NDE of Hull and Machinery Steel Castings. Welded steel anchors are to be inspected at the welds. At sections of high load or at suspect areas, the Society may impose volumetric nondestructive examination; e.g ultrasonic inspection, or radiographic inspection.

At the discretion of the Society, additional tests of the anchor may be required. These tests include the hammering test and the drop test, and are usually applied to cast steel anchors.

A1
cont'd

A1.4.4 Anchor Material Selection and Toughness

All SHHP anchors are to be manufactured from materials meeting the requirements of the IACS URs as follows:

Welded Steel Anchors:	UR W11	Normal and Higher Strength Hull Structural Steel
	UR W17	Approval of consumables for welding normal and higher strength hull structural steel
Cast Steel Anchors:	UR W8	Hull and machinery steel castings
Anchor Shackles:	UR W7	Hull and machinery steel forgings
	UR W8	Hull and machinery steel castings

The base steel grades in welded SHHP anchors are to be selected with respect to the Material Grade Requirements for Class II of S6.1 in UR S-6 "Use of steel grades for various hull members". The welding consumables are to meet the toughness for the base steel grades in accordance with UR W17 "Approval of consumables for welding normal and higher strength hull structural steel". The toughness of the anchor shackles for SHHP anchors is to meet that for Grade 3 anchor chain in accordance with UR W18 "Anchor chain cables and accessories". The toughness of steel castings for SHHP anchors is to be not less than a Charpy V-notch energy average of 27 J at 0 degree C.

A1.4.5 Fabricated Anchors

Fabricated anchors are to be manufactured in accordance with approved welding procedures using approved welding consumables and carried out by qualified welders.

A1
cont'd

A1.5 Chain cables for bower anchors
(1981) (1999)

A1.5.1 Anchor Cable Design

A1.5.1.1 The chain cable is to be as required by Table 1 for the calculated equipment number for the vessel. The anchor cable is to be tested in accordance with Table 5 to the test loads corresponding to those for the required chain cable.

A1.5.1.2 Where the vessel may anchor in areas where the current exceeds 2.5 m/s, the need to provide a length of heavier chain cable locally between the anchor and the rest of the chain to enhance anchor bedding may be required at the discretion of the Classification Society.

A1.5.1.3 For certain restricted services the use of steel wire rope may be accepted in place of chain cable at the discretion of the classification society.

A1.5.2 Grades of chain cables

Bower anchors are to be associated with stud link chain cables for one of the grades listed in Table 3.

Table 3 Grades of chain cables

Material	Grade	Range of UTS (N/mm ²)
Mild steel	1	300 to 490 (31 ÷ 50 kg/mm ²)
Special quality steel	2	490 to 690 (50 ÷ 70 kg/mm ²)
Extra special quality steel	3	> 690 (>70 kg/mm ²)

NOTE

The designation “Grade 1” may be replaced, at discretion of each Classification Society, by “Grade 1a” where UTS is greater than 300 but not exceeding 400 N/mm² or by “Grade 1b” where UTS is greater than 400 but not exceeding 490 N/mm².

A1.5.3 Proof and breaking loads of stud link chain cables

(a) The design and/or standard breaking loads BL and proof load PL (expressed in kN) of stud link chain cables are given in Table 4 being d the chain diameter (mm).

Table 4

Grade	BL	PL
1	$BL_1 = 9,80665 \times 10^{-3} [d^2 (44 - 0,08 d)]$	$PL_1 = 0,7 BL_1$
2	$BL_2 = 1,4 BL_1$	$PL_2 = BL_1$
3	$BL_3 = 2 BL_1$	$PL_3 = 1,4 BL_1$

A1
cont'd

- (b) The test load values, rounded off from the loads in (a) above to be used for testing and acceptance of chain cables, are given in Table 5.

Table 5 Test Load Values for Stud Link Chains

A1.6 Permissible Weardown of Stud Link Chain Cable for Bower Anchors
(1992)

When a length of chain cable is so worn that the mean diameter of a link, at its most worn part, is reduced by 12% or more from its required nominal diameter it should be renewed.

The mean diameter is half the value of the sum of the minimum diameter found in one cross-section of the link and of the diameter measured in a perpendicular direction in the same cross-section.

END

A2

(Jan 2004)
 (Corr.1 Feb 2004)
 Rev.1 July 2004)
 (Rev.2 Sept 2006)
 (Rev.3 July 2007)
 (Corr.1 Sept 2014)

Shipboard fittings and supporting hull structures associated with towing and mooring on conventional vessels

A 2.0. Application and Definitions

This unified requirement is to apply to design and construction of shipboard fittings and supporting structures used for the normal towing and mooring operations. For the emergency towing arrangements, ships subject to SOLAS regulation II-1/3-4 are to comply with that regulation and resolution MSC.35(63) as may be amended.

The net minimum scantlings of the supporting hull structure are to comply with the requirements given in A 2.1.5 and A 2.2.5. The net thicknesses, t_{net} , are the member thicknesses necessary to obtain the above required minimum net scantlings. The required gross thicknesses are obtained by adding the total corrosion additions, t_c , given in A 2.4, to t_{net} .

For the purpose of this requirement:

- conventional vessels means new displacement-type vessels of 500 GT and above, excluding high speed craft, special purpose vessels, and offshore units of all types.
- shipboard fittings mean those components limited to the following: bollards and bitts, fairleads, stand rollers, chocks used for the normal mooring of the vessel and the similar components used for the normal towing of the vessel. Other components such as capstans, winches, etc. are not covered by this Unified Requirement. Any weld or bolt or equivalent device connecting the shipboard fitting to the supporting structure is part of the shipboard fitting and subject to the Industry standard applicable to this shipboard fitting.
- Supporting hull structures means that part of the ship structure on/in which the shipboard fitting is placed and which is directly submitted to the forces exerted on the shipboard fitting. The supporting hull structure of capstans, winches, etc. used for the normal towing and mooring operations mentioned above is also subject to this Unified Requirement.
- Industry standard means international standard (ISO, etc.) or standards issued by national association such as DIN or JMSA, etc. which are recognized in the country where the ship is built.

Note:

1) Corr.1 Feb 2004 is to be applied by all Member Societies and Associates to ships contracted for construction after 1 Jan 2005.

2) The "contracted for construction" date means the date on which the contract to build the vessel is signed between the prospective owner and the shipbuilder. For further details regarding the date of "contract for construction", refer to IACS Procedural Requirement (PR) No. 29.

3) Revision 2 of this UR is to be applied by all IACS Members and Associates to ships contracted for construction from 1 January 2007.

4) Revision 3 of this UR is to be uniformly implemented by all IACS Members and Associates to ships contracted for construction from 1 January 2007.

A2 (cont)

A 2.1. Towing

A 2.1.1. Strength

The strength of shipboard fittings used for normal towing operations at bow, sides and stern and their supporting hull structures are to comply with the requirements of this Unified Requirement.

A 2.1.2. Arrangement

Shipboard fittings for towing are to be located on longitudinals, beams and/or girders, which are part of the deck construction so as to facilitate efficient distribution of the towing load. Other arrangements may be accepted (for Panama chocks, etc.) provided the strength is confirmed adequate for the intended service.

A 2.1.3. Load considerations

Unless greater safe working load (SWL) of shipboard fittings is specified by the applicant, the minimum design load to be used is the following value of (1) or (2), whichever is applicable:

- (1) for normal towing operations (e.g. harbour/manoeuvring), 1.25 times the intended maximum towing load (e.g. static bollard pull) as indicated on the towing and mooring arrangements plan.
- (2) for other towing service (e.g. escort), the nominal breaking strength of the tow line according to the IACS Recommendation No. 10 "Equipment" for the ship's corresponding EN is to be applied. (see Note)

Note: Side projected area including maximum stacks of deck cargoes is to be taken into account for selection of towing lines. For the application of UR A2, the breaking loads of towing lines specified in IACS Recommendation 10 are mandatory in order to determine the design load applied to shipboard fittings and supporting hull structure. The remainder of IACS Recommendation 10 is for guidance.

The design load is to be applied through the tow line according to the arrangement shown on the towing and mooring arrangements plan.

When a specific SWL is applied for a shipboard fitting at the request of the applicant, by which the design load will be greater than the above minimum values, the strength of the fitting is to be designed using this specific design load.

The method of application of the design load to the fittings and supporting hull structures is to be taken into account such that the total load need not be more than twice the design load, i.e. no more than one turn of one line (see figure below).

A2
(cont)**A 2.1.4. Shipboard fittings**

The selection of shipboard fittings is to be made by the shipyard in accordance with an Industry standard (e.g. ISO 13795 Ships and marine technology – Ship's mooring and towing fittings – Welded steel bollards for sea-going vessels) accepted by the society. When the shipboard fitting is not selected from an accepted Industry standard, the design load used to assess its strength and its attachment to the ship is to be in accordance with A 2.1.3

A 2.1.5. Supporting hull structure**(1) Arrangement**

The reinforced members (carling) beneath shipboard fittings are to be effectively arranged for any variation of direction (horizontally and vertically) of the towing forces (which is to be not less than the Design Load as per A 2.1.3) acting through the arrangement of connection to the shipboard fittings.

(2) Acting point of towing force

The acting point of the towing force on shipboard fittings is to be taken at the attachment point of a towing line or at a change in its direction.

(3) Allowable stresses

Allowable stresses under the design load conditions as specified in A2.1.3 are as follows:

Normal stress: 100% of the specified minimum yield point of the material;
Shearing stress: 60% of the specified minimum yield point of the material;

No stress concentration factors being taken into account.

Normal stress is the sum of bending stress and axial stress with the corresponding shearing stress acting perpendicular to the normal stress.

A 2.1.6. Safe Working Load (SWL)

- 1) The SWL used for normal towing operations (e.g. harbour/manoeuvring) is not to exceed 80% of the design load per A 2.1.3(1) and the SWL used for other towing operations (e.g. escort) is not to exceed the design load per A 2.1.3(2). For fittings used for both normal and other towing operations, the greater of the design loads of A 2.1.3(1) and A 2.1.3(2) is to be used.
- 2) The SWL of each shipboard fitting is to be marked (by weld bead or equivalent) on the deck fittings used for towing.
- 3) The above requirements on SWL apply for a single post basis (no more than one turn of one cable).
- 4) The towing and mooring arrangements plan mentioned in A 2.3 is to define the method of use of towing lines.

A2
(cont)**A 2.2. Mooring****A 2.2.1. Strength**

The strength of shipboard fittings used for mooring operations and their supporting hull structures are to comply with the requirements of this Unified Requirement.

A 2.2.2. Arrangement

Shipboard fittings for mooring are to be located on longitudinals, beams and/or girders, which are part of the deck construction so as to facilitate efficient distribution of the mooring load. Other arrangements may be accepted (for Panama chocks, etc.) provided the strength is confirmed adequate for the service.

A 2.2.3. Load considerations

- 1) Unless greater safe working load (SWL) of shipboard fittings is specified by the applicant, the design load applied to shipboard fittings and supporting hull structures is to be 1.25 times the breaking strength of the mooring line according to the IACS Recommendation No. 10 "Equipment" for the ship's corresponding EN. (see Note)

Notes:

1. Side projected area including maximum stacks of deck cargoes is to be taken into account for assessment of lateral wind forces, arrangements of tug boats and selection of mooring lines.
 2. For the application of UR A2, the breaking loads of mooring lines specified in IACS Recommendation 10 are mandatory in order to determine the design load applied to shipboard fittings and supporting hull structure.
 3. In line with the footnote of Table 5 of IACS Recommendation No. 10, for the individual mooring lines with breaking strength above 490 kN, this breaking strength may be reduced with corresponding increase of number of the mooring lines, provided that the total breaking load of all lines aboard the ship is not less than the total loads as specified. The number of mooring lines is not to be less than 6 and no one line is to have a strength less than 490 kN. (See also A2.3, Mooring arrangement plan.)
 4. The remainder of IACS Recommendation 10 is for guidance.
- 2) The design load applied to supporting hull structures for winches, etc. is to be 1.25 times the intended maximum brake holding load and, for capstans, 1.25 times the maximum hauling-in force.
 - 3) The design load is to be applied through the mooring line according to the arrangement shown on the towing and mooring arrangements plan.
 - 4) The method of application of the design load to the fittings and supporting hull structures is to be taken into account such that the total load need not be more than twice the design load specified in 1) above, i.e. no more than one turn of one line.
 - 5) When a specific SWL is applied for a shipboard fitting at the request of the applicant, by which the design load will be greater than the above minimum values, the strength of the fitting is to be designed using this specific design load.

A2
(cont)**A 2.2.4. Shipboard fittings**

The selection of shipboard fittings is to be made by the shipyard in accordance with an Industry standard (e.g. ISO 13795 Ships and marine technology – Ship's mooring and towing fittings – Welded steel bollards for sea-going vessels) accepted by the society. When the shipboard fitting is not selected from an accepted Industry standard, the design load used to assess its strength and its attachment to the ship is to be in accordance with A 2.2.3

A 2.2.5. Supporting hull structure**(1) Arrangement**

Arrangement of the reinforced members (carling) beneath shipboard fittings is to consider any variation of direction (horizontally and vertically) of the mooring forces (which is to be not less than the Design Load as per A 2.2.3) acting through the arrangement of connection to the shipboard fittings.

(2) Acting point of mooring force

The acting point of the mooring force on shipboard fittings is to be taken at the attachment point of a mooring line or at a change in its direction.

(3) Allowable stresses

Allowable stresses under the design load conditions as specified in A2.2.3 are as follows:

Normal stress: 100% of the specified minimum yield point of the material;
Shearing stress: 60% of the specified minimum yield point of the material;

No stress concentration factors being taken into account. Normal stress is the sum of bending stress and axial stress with the corresponding shearing stress acting perpendicular to the normal stress.

A 2.2.6. Safe Working Load (SWL)

- 1) The SWL is not to exceed 80% of the design load per A 2.2.3.
- 2) The SWL of each shipboard fitting is to be marked (by weld bead or equivalent) on the deck fittings used for mooring.
- 3) The above requirements on SWL apply for a single post basis (no more than one turn of one cable).
- 4) The towing and mooring arrangements plan mentioned in A 2.3 is to define the method of use of mooring lines.

A 2.3. Towing and mooring arrangements plan

- 1) The SWL for the intended use for each shipboard fitting is to be noted in the towing and mooring arrangements plan available on board for the guidance of the Master.
- 2) Information provided on the plan is to include in respect of each shipboard fitting:

A2
(cont)

- .1 location on the ship;
 - .2 fitting type;
 - .3 SWL;
 - .4 purpose (mooring/harbour towing/escort towing); and
 - .5 manner of applying towing or mooring line load including limiting fleet angles.
- 3) Where the arrangements and details of deck fittings and their supporting hull structures are designed based on the mooring arrangements as permitted in Note 3 to A 2.2.3.1, the following information is to be clearly indicated on the plan:
- .1 the arrangement of mooring lines showing number of lines (N), together with
 - .2 the breaking strength of each mooring line (BS).

This information is to be incorporated into the pilot card in order to provide the pilot proper information on harbour/escorting operations.

A 2.4. Corrosion Addition

The total corrosion addition, t_c , in mm, for both sides of the hull supporting structure is not to be less than the following values:

- Ships covered by CSR for bulk carriers and CSR for double hull oil tankers: Total corrosion additions defined in these rules
- Other ships: 2.0

A 2.5. Survey After Construction

The condition of deck fittings, their pedestals, if any, and the hull structures in the vicinity of the fittings are to be examined in accordance with the society's Rules. The wastage allowances as specified by the society's Rules are not to exceed the corrosion addition as specified in A2.4.
